Владислав Гимадиев

Senior Frontend Developer

TG @vlaad_g **Email** vlad.gimadiev@mail.ru **Phone** +79082439925 **Location** Saint Petersburg, hybrid or remote, open to relocation

Senior Frontend Developer with 4 years of commercial experience. I build client-side web and desktop products with Vue 3, TypeScript, Electron, and Tauri. I designed frontend architecture based on Clean Architecture and Feature-Sliced Design, graph editors with complex logic, streaming-data visualization interfaces, and internal UI libraries. On the latest project, I was responsible for architecture, key product modules, and frontend engineering practices.

EXPERIENCE

SoftCom LLC — 2022–2026

During my time at SoftCom, I grew from a junior fullstack developer on Java and Vue to a senior frontend developer. I first worked on backend integrations and admin interfaces, then focused on the client side of desktop modeling applications, graph editors, streaming data, and frontend architecture.

Senior Frontend Developer — 2025–2026

Stack: JavaScript ES6+, TypeScript, Vue 3, Composition API, Electron, Tauri, Pinia, VueFlow, Chart.js, Vuelidate, Cypress, Webpack, Vite, Docker.
Team: lead, 4 frontend developers, 6 backend developers, 2 manual QA engineers.

As a senior developer, I was responsible for frontend architecture, decomposition of large tasks, technical decisions, code reviews, onboarding new team members, effort estimation, architecture decision documentation, technical debt management, development of the UI library and test infrastructure, and API contract design with the backend team. During this period, the team worked on a new universal design and modeling system: the product evolved the previous system, but the frontend architecture was rebuilt around Feature-Sliced Design, Clean Architecture, independent modules, and a shared UI layer.

- Designed the frontend architecture of the new product on Vue 3 and TypeScript: chose a custom approach between Clean Architecture for business-logic isolation and Feature-Sliced Design for frontend modularity, then adapted it to Composition API, Pinia, and frequent UI changes. This structure avoided excessive interfaces, adapters, and rigid FSD rules, while a team of 4 frontend developers worked in parallel across 3 key areas without conflicts around module boundaries.
- Built the key sections for projects, requirements, design, and modeling on Vue 3. These 4 sections covered the core product scenarios and gave the team a stable foundation for future features without rewriting the initial structure.
- Developed the schema module on VueFlow and worked with the backend team to move updates from PUT to PATCH. Partial updates reduced transmitted data, supported composite blocks, and improved average schema save time by 30–40%.
- Built a detailed schema mode in VueFlow where a block opened as a composite node, its parameters became child elements, and links were shown only between parameters. The 2nd display mode helped engineers inspect complex models at the parameter level without a separate screen or manual link matching.
- Created and maintained an internal library of 40+ UI components for 3 main company projects. Teams reused ready-made buttons, forms, and base elements in similar modules, so they did not rebuild the same interface and reduced time on typical UI scenarios by about 20–30%.
- Set up component testing in Cypress for the internal library and added a code coverage metric. A threshold of at least 75% helped catch issues in shared components before changes reached 3 product codebases.
- Organized onboarding for 2 interns through daily calls, code reviews, and decomposition of part of my large task into smaller tasks suitable for their level. Over the period, I completed 150+ code reviews, kept estimation error below 30%, both interns passed performance review, and the team closed the sprint a week earlier.

Middle Frontend Developer — 2023–2025

Stack: JavaScript ES6+, TypeScript, Vue 3, Composition API, Electron, Tauri, Pinia, Vuetify, ag-Grid, VueFlow, Chart.js, OpenLayers, WebSocket, Vuelidate, Cypress.
Team: lead, 3 frontend developers, 5 backend developers, 2 manual QA engineers.

After the fullstack stage, I fully moved into frontend and worked on a desktop application on Electron and Tauri for designing a mathematical flight model of an aircraft. I mainly worked on the graph constructor, live simulation data, maps, charts, large tables, and common rules for forms.

- Built an interactive schema constructor on VueFlow with drag-and-drop blocks, connections, a context menu, parameter settings, and undo/redo. One module combined 5 key schema workflows, so users assembled the model and rolled back actions without developer support.
- Designed complex connection-inside-connection logic through drag-and-drop. Users connected blocks and individual parameters across 2 model levels, which helped describe nested dependencies in engineering schemas without manual workarounds.
- Set up streaming data through WebSocket and live rendering of trajectories, points, areas, and images on OpenLayers maps and Chart.js charts at up to 10 frames per second. The module displayed 30+ visual metrics, so engineers analyzed the simulation while it was running, not only after the final result.
- Migrated table views from custom implementations to ag-Grid and configured filtering, sorting, and pagination for datasets of up to 10,000+ records. Users worked faster with large tables, and the team maintained one standard tool instead of a set of separate table implementations.
- Created a unified form validation layer on Vuelidate and moved repeated validation rules into shared functions. The team changed rules in 1 place, and application forms displayed errors consistently without duplicated logic.

Junior Fullstack Developer — 2022–2023

Stack: Java, Spring, Vue 3, Element Plus, Keycloak, GitLab CI/CD, PostgreSQL.

Started with an enterprise employee testing system with voice answers. Administrators managed client companies, users, tariffs, and survey scenarios, while employees took tests according to configured rules.

- Built an admin panel on Vue 3 and Element Plus for managing client companies, users, and tariffs. One interface covered 3 administrative workflows and removed the need to manage client settings through the database or manual operations.
- Designed and built a survey scenario builder on Vue 3 for 2 setting types, questions and voice answers. Administrators assembled new surveys in the interface, so the business launched scenarios without separate developer changes for each test.
- Split the monolithic repository into modules and set up separate GitLab CI/CD pipelines for each module. Development, builds, and releases became more independent, and changes in 1 part of the system affected the rest less often.
- Implemented integration with the Keycloak API and creation of the initial administrator on the first product launch. The team deployed an environment with basic access ready in 1 launch without manual account setup.
- Adapted the voice-answer analysis module and wrote a local mock server on Spring. This removed dependence on the external analysis module and helped frontend and backend development continue in 2 parallel tracks.

TOOLS

JavaScript ES6+, TypeScript, Java, SQL, Vue 3, Composition API, Pinia, VueFlow, Vuetify, Element Plus, Vuelidate, Chart.js, Vue Router, Vitest, ag-Grid, OpenLayers, Electron, Tauri, WebSocket, REST API, Spring, Keycloak, PostgreSQL, Cypress, Webpack, Vite, GitLab CI/CD, Docker, Git

EDUCATION

Saint Petersburg State University, Faculty of Mathematics and Mechanics 2021–2023

Master's degree, Mechanics and Mathematical Modeling.

Saint Petersburg State University, Faculty of Mathematics and Mechanics 2017–2021

Bachelor's degree, Mechanics and Mathematical Modeling.

RESEARCH

- Co-authored the paper Numerical simulation of hypersonic flow with non-equilibrium chemical reactions around sphere in Acta Astronautica, Elsevier, Scopus/SJR Q1. The work focuses on numerical simulation of hypersonic flow around a sphere, non-equilibrium chemical reactions in high-temperature air, and comparison of numerical results with experimental data.
- Co-authored the paper Numerical simulation of hypersonic flow around semi-sphere with non-equilibrium physical and chemical processes in high-temperature air in Numerical Methods and Programming, VAK K1, RSCI, and Russian Science Citation Index core. The work focuses on hypersonic flow around a semi-sphere, non-equilibrium physical and chemical processes in high-temperature air, and calculations across a wide Mach number range. Compared with the first paper, it adds results for a more detailed air composition and accounts for ionization.
